# Bivariate normal

**Def:** A two dimensional random vector  $\mathbf{X} = \begin{pmatrix} X_1 \\ X_2 \end{pmatrix}$  is said to have a bivariate normal distribution if  $aX_1 + bX_2$  is a univariate normal for all  $(a, b) \in \mathbb{R}^2 \setminus (0, 0)$ .

**Theorem:** If  $\mathbf{X}$  has bivariate normal distribution, then each of  $X_1$  and  $X_2$  is univariate normal. Hence,  $E(X_1)$ ,  $E(X_2)$ ,  $Var(X_1)$ ,  $Var(X_2)$ , and  $Cov(X_1, X_2)$  exist.

Let us denote  $\boldsymbol{\mu} = E(\mathbf{X}) = \begin{pmatrix} \mu_1 \\ \mu_2 \end{pmatrix}$  and  $\Sigma = Var(\mathbf{X}) = \begin{pmatrix} \sigma_{11} & \sigma_{12} \\ \sigma_{21} & \sigma_{22} \end{pmatrix}$ , where  $\mu_1 = E(X_1)$ ,  $\mu_2 = E(X_2)$ ,  $\sigma_{11} = Var(X_1)$ ,  $\sigma_{22} = Var(X_2)$ , and  $\sigma_{12} = \sigma_{21} = Cov(X_1, X_2)$ .

# Bivariate normal

**Theorem:** Let  $\mathbf{X}$  be a bivariate normal random vector. If  $\boldsymbol{\mu} = E(\mathbf{X})$  and  $\Sigma = \text{Var}(\mathbf{X})$ , then for any fixed  $\mathbf{u} = (a, b) \in \mathbb{R}^2 \setminus (0, 0)$ ,

$$\mathbf{u}'\mathbf{X} \sim N(\mathbf{u}'\boldsymbol{\mu}, \mathbf{u}'\Sigma\mathbf{u}).$$

**Theorem:** Let  $\mathbf{X}$  be a bivariate normal random vector, then  $M_{\mathbf{X}}(\mathbf{t}) = e^{\mathbf{t}'\boldsymbol{\mu} + \frac{1}{2}\mathbf{t}'\Sigma\mathbf{t}}$  for all  $\mathbf{t} \in \mathbb{R}^2$ .

**Remark:** Thus the bivariate normal distribution is completely specified by the mean vector  $\boldsymbol{\mu}$  and the variance-covariance matrix  $\Sigma$ . We may therefore denote a bivariate normal distribution by  $N_2(\boldsymbol{\mu}, \Sigma)$ .

**Def:** A two dimensional random vector  $\mathbf{X}$  is said to have a bivariate normal distribution if it can be expressed in the form  $\mathbf{X} = \boldsymbol{\mu} + A\mathbf{Y}$ , where  $A$  is a  $2 \times 2$  matrix of real numbers,  $\mathbf{Y} = (Y_1, Y_2)$  and  $Y_1$  and  $Y_2$  are i.i.d  $N(0, 1)$ . In this case  $E(\mathbf{X}) = \boldsymbol{\mu}$  and  $\Sigma = AA'$ .

**Theorem:** If  $\mathbf{X} \sim N_2(\boldsymbol{\mu}, \Sigma)$ , then  $X_1 \sim N(\mu_1, \sigma_{11})$  and  $X_2 \sim N(\mu_2, \sigma_{22})$ .

**Remark:** The converse of the above theorem is not true.

**Remark:** If  $\mathbf{X} \sim N_2(\boldsymbol{\mu}, \Sigma)$  and  $Cov(X_1, X_2) = 0$ , then  $X_1$  and  $X_2$  are independent.

**Theorem:** Let  $\mathbf{X} \sim N_2(\boldsymbol{\mu}, \Sigma)$  be such that  $\Sigma$  is invertible, then, for all  $\mathbf{x} \in \mathbb{R}^2$ ,  $\mathbf{X}$  has a joint PDF given by

$$\begin{aligned} f(\mathbf{x}) &= \frac{1}{2\pi|\Sigma|^{1/2}} \exp \left\{ -\frac{1}{2}(\mathbf{x} - \boldsymbol{\mu})' \Sigma^{-1}(\mathbf{x} - \boldsymbol{\mu}) \right\} \\ &= \frac{1}{2\pi\sigma_x\sigma_y\sqrt{1-\rho^2}} e^{A(x, y, \mu_x, \mu_y, \sigma_x, \sigma_y, \rho)}, \end{aligned}$$

where

$$A = -\frac{1}{2(1-\rho^2)} \left\{ \left( \frac{x - \mu_x}{\sigma_x} \right)^2 - 2\rho \left( \frac{x - \mu_x}{\sigma_x} \right) \left( \frac{y - \mu_y}{\sigma_y} \right) + \left( \frac{y - \mu_y}{\sigma_y} \right)^2 \right\}.$$
